Definition

Dynamic Programming is a technique for efficiently recurrence computing by storing partial results.

In this slides, I will NOT use too many formal words, but only look on some *interesting problems*.

The First Problem

Dynamic Programming

Shuang Zhao

Outline

Introduction

What is DP

First Problem

Second Problem

Partial Result

Tiling Counting

String Counting

Approach 1

Approach 2

Appendix

Proof 1

Proof 2

Longest Ascending Subsequence

- $P : a_1, a_2, \dots, a_n$.
- $Q : a_{b_1}, a_{b_2}, \dots, a_{b_k}$, satisfying

$$1 \leq b_1 < b_2 < \dots < b_k \leq n$$

and

$$a_{b_1} < a_{b_2} < \dots < a_{b_k}$$

- We say Q is an **ascending subsequence** of P .
- Your task is: given a sequence P , find the length its **longest** ascending subsequence (**LAS**).

The First Problem

Dynamic Programming

Shuang Zhao

Introduction

What is DP

First Problem

Second Problem

Partial Result

Tiling Counting

String Counting

Optimization

Approach 1

Approach 2

Appendix

Proof 1

Proof 2

Longest Ascending Subsequence

- We use f_i to denote the length of P 's LAS *ending* with element a_i .
- Let $a_0 := -\infty, f_0 := 0$. Then we have

$$f_k = \max_{0 \leq i < k} \{f_i + 1 : a_i < a_k\}, \quad 1 \leq k \leq n$$

- Hence the length of P 's LAS is $\max\{f_i\}$.
- This naive **Dynamic Programming** algorithm runs in $O(n^2)$ time, and later we will look on this problem again.

The Second Problem

Dynamic Programming

Shuang Zhao

Outline

Introduction

What is DP

First Problem

Second Problem

Partial Result

Tiling Counting

String Counting

Optimization

Approach 1

Approach 2

Appendix

Proof 1

Proof 2

Shortest Hamilton Path

- This problem is \mathcal{NP} -hard.
- When $|V|$ is small, one FAST algorithm to solve this problem is **Dynamic Programming**.
- Use $f_{i,S'}$ where $i \in V$, $S' \subseteq S$ to denote the length of shortest Hamilton path over S' , which ending at vertex i .
- Then $\min_{i \in V} \{f_{i,S}\}$ is what we want, and

$$f_{i,S'} = \min_{j \in S'} \{f_{j,S'-\{i\}} + w(j, i)\}$$

- This algorithm runs in $O(|V|^2 \cdot 2^{|V|})$ time.

Shuang Zhao

Outline

Introduction

What is DP
First Problem
Second Problem

Partial Result

Tiling Counting
String Counting

Optimization

Approach 1
Approach 2

Appendix

Proof 1
Proof 2

The partial results are:

- Let $f_{i,j}$ to be the number of ways to cover pattern $P_{i,j}$.
- And

$$f_{i,j} = \begin{cases} 1 & j = 0 \\ 0 & \text{otherwise} \end{cases} \quad i = 0$$
$$f_{i,j} = \sum_{P_{i,j} \succ P_{i-1,j'}} f_{i-1,j'} \quad 0 < i < n$$

- Finally $f_{n-1,(111111)_2}$ is the answer to this problem.
- By a coarse calculation, we know this algorithm runs in $O(2^6 \cdot N \cdot 4^6) = O(N)$ time.

Definition

Let \trianglelefteq and \trianglerighteq be two binary relations over Σ^* :

$$x \trianglelefteq y \iff x \text{ is a prefix of } y$$

$$x \trianglerighteq y \iff x \text{ is a suffix of } y$$

Definition

We define the **prefix set of S** ($S \neq \emptyset$) by

$$\text{pre}(S) := \{s' : (\exists s \in S)(s' \trianglelefteq s)\}$$

Obviously, $S \subseteq \text{pre}(S)$.

String Counting

For instance, let $\Sigma := \{a, b, c\}$ and $S := \{aa, ba, cba\}$, then

$$\text{pre}(S) = \{\varepsilon, a, aa, b, ba, c, cb, cba\}$$

Proof (Part 3).

When $i_1 < i_2 < j_1 < j_2$, we prove by induction on $j_2 - i_1$.
Let

$$F[i_2, j_1] = F[i_2, k - 1] + F[k + 1, j_1] + W[i_2, j_1]$$

$$F[i_1, j_2] = F[i_1, t - 1] + F[t + 1, j_2] + W[i_1, j_2]$$

Without loss of generality, $t \leq k$. Hence $i_1 \leq t \leq k \leq j_1$.

Then we have

$$\begin{aligned} & F[i_1, j_1] + F[i_2, j_2] \\ & \leq F[i_1, t-1] + F[t+1, j_1] + W[i_1, j_1] \\ & \quad + F[i_2, k-1] + F[k+1, j_2] + W[i_2, j_2] \\ & \leq F[i_1, t-1] + F[t+1, j_2] + W[i_1, j_2] \\ & \quad + F[i_2, k-1] + F[k+1, j_1] + W[i_2, j_1] \\ & = F[i_1, j_2] + F[i_2, j_1] \end{aligned}$$

(In the OBST problem)

Proposition

$s(i, j)$ is monotonic, namely for all $1 \leq i \leq j < n$,

$$s(i, j) \leq s(i, j + 1) \leq s(i + 1, j + 1)$$

Proof.

By symmetry, we need only to prove that $s(i, j) \leq s(i, j + 1)$.
When $i = j$, $s(i, j) = i \leq s(i, j + 1)$.

Next we assume $i < j$. For convenience, we use symbol $F_k[i, j]$ to be the short form of $F[i, k - 1] + F[k + 1, j] + W[i, j]$. So $F_{s(i,j)}[i, j] = F[i, j]$.

Since matrix F is *totally monotonic*, for all $k \leq k' \leq j$,

$$F[k + 1, j] + F[k' + 1, j + 1] \leq F[k' + 1, j] + F[k + 1, j + 1]$$

Thus

$$\begin{aligned} & F[i, k-1] + F[k+1, j] + W[i, j] \\ & \quad + F[i, k'-1] + F[k'+1, j+1] + W[i, j+1] \\ \leq & F[i, k-1] + F[k+1, j+1] + W[i, j+1] \\ & \quad + F[i, k'-1] + F[k'+1, j] + W[i, j] \end{aligned}$$

namely

$$F_k[i, j] + F_{k'}[i, j+1] \leq F_k[i, j+1] + F_{k'}[i, j]$$

that is

$$F_k[i, j] - F_{k'}[i, j] \leq F_k[i, j+1] - F_{k'}[i, j+1]$$

Therefore

$$F_{k'}[i, j] \leq F_k[i, j] \rightarrow F_{k'}[i, j + 1] \leq F_k[i, j + 1]$$

For all $k < s(i, j)$, $F_{s(i, j)}[i, j] = F[i, j] \leq F_k[i, j]$.

So $F_{s(i, j)}(i, j + 1) \leq F_k(i, j + 1)$.

Hence $F_{s(i, j)}[i, j + 1] \leq F_k[i, j + 1]$.

This gives $s(i, j) \leq s(i, j + 1)$. □
